

# What Is Leak Detection?

Leak Detection is what we service to accommodate a water leak that you may not be able to see or isolate. Leaks do happen a lot through internal pipe work in your walls or underground that may have collapsed or broken.

## What Can Cause Water Leaks?

Corrosion is a major cause for pipe work to collapse. This can be caused by the pH levels of your water. This would generally cause a pinhole leak. The earth movement or natural movement can disrupt your pipes around, this can cause your pipes to rub on rocks or shale earth which can create holes. You will know if you have undetected water leaks if you have an unusually high water bill.

## How Can I Tell If I Have A Water Leak?

To find out what's happening with your pipes, ensure no water is being used inside or outside your house. Turn off all taps, dishwasher, washing machines, and other gardening sprinklers. Locate your water meter and check the leak indicator to see if it is moving. If it's still going up you have a leak somewhere on the property. If still unsure come back in 2 hours and take another meter reading. Again make sure no water is being used.

[Jetset Plumbing can detect your leak](#), but also carry out any repairs that may be required.
